Story of the game for the paper prototype:
The game is set in a post-apocalyptic world where the results of nuclear warfare still remain evident in even the air that the survivors breathe. Your role as a “Cleanser” is to lead an expedition team of settlers to test whether or not the new land you have found is suitable for the rest of the main group to move to. As the Cleanser, you must make choices that will prioritise the survival of the town by choosing the right trades at the specific times. The settlers that you lead will generate the resources that the town will need to survive the period of time that the expedition team will need to hold out for until the main team arrives. There will be a random number of events that can happen every round which may help the town's survival or harm the town depending on the current stats of the town.
The task is simple. Keep your town alive to live another day.

Currently, there are 4 stats players must manage:

- Food and water: These stats must be above or equal to the number of survivors currently alive in order to proceed to the next round.
- Military: There are raid events that will check the military stat to see if the raid is successful or not. Players must have an equal or greater number to military stat to the raid check to suppress the raid.
- Gold: The currency used for trades.

The only ways to produce these resources are by the settlers who are still alive or by trading. Some events can also give resources.

Rules of paper prototype:

- At the end of each round, players can choose to make a trade with the trade cards presented to them.
- Players can only make 1 trade per round.
- Players can spend 1 gold to draw new cards for the trade, but after the first re-roll, the cost will double each time
- There will be special raid events where players must have the same or greater amount of military stats to the raid’s military check in order to suppress the raid.
- At the end of each round, the resources generated by the civilians alive will be tallied.
- The town must have a specific number of resources in order to proceed to the next round, the specific number of resources required will be deducted from the number of resources the town currently has.
- Keep as many of the settlers alive for as long as possible.
